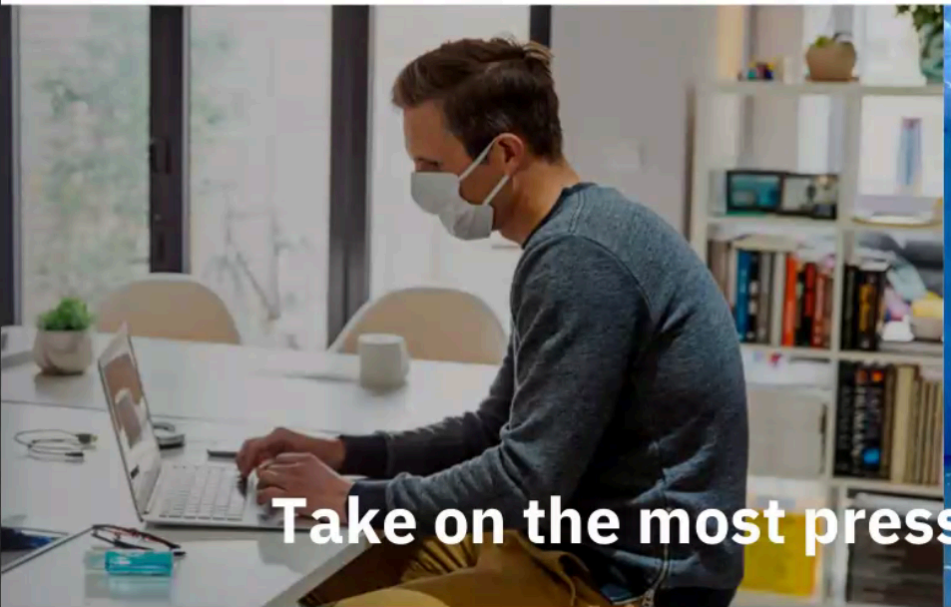
IBM

2020 CALL FOR 2020 CODE®

Global Challenge

COVID-19 has revealed limits of the systems we take for granted, compromising our health, our planet, and our survival.

We've expanded the 2020 Call for Code Global Challenge to take on COVID-19, while we remain steadfastly committed to combating climate change.



Take on the most pressing issues of our time

2020 CALL FOR CODE®
Global Challenge

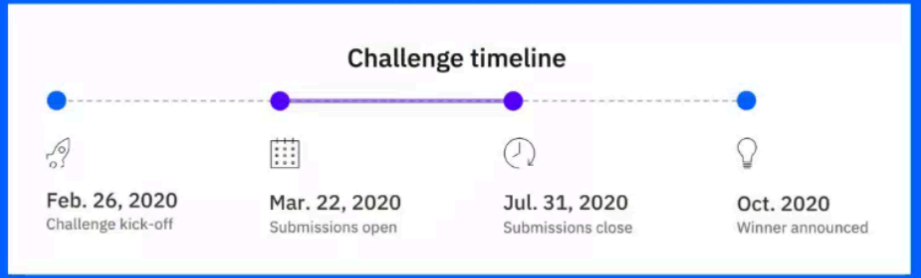
Why Call for Code matters to IBM and the world

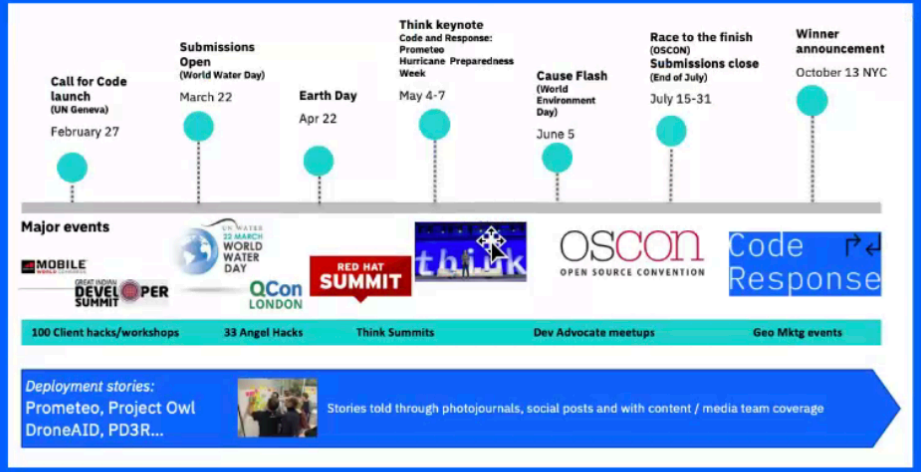
- We are in year three of our five-year commitment as a Founding Partner of Call for Code in partnership with David Clark Cause and the United Nations
- Call for Code is a multi-month yearly competition that builds upon IBM's history of matching technology to the world's greatest challenges
- This differs from other technology-for-good competitions in that we deploy the winning solutions through Code and Response
- This isn't just about the money, there are additional prizes that encourage sustainable open source solutions
- We raise awareness of the IBM Cloud among our existing ecosystem and new participants
  - They learn about IBM, Red Hat, and open source solutions and build skills while pursuing tech for good
  - We hope they have a positive experience that they bring to the communities that they in turn influence as decisionmakers

ibm.biz/callforcode

2020 CALL FOR CODE®
Global Challenge

What does the competition and event schedule look like?





Agenda:

1. microservices in a cloud
2. containers to host microservices
3. Docker to build-ship-run containers
4. orchestration of many containers
5. Kubernetes
6. Helm
7. Istio
8. OKD
9. Red Hat OpenShift vs Kubernetes

Container story

About Microservice
APIs
Docker

How you build a microservice

IT IS A SIMPLE PROGRAM – RESPONDING TO CRUD OPERATIONS

WHAT is a microservice?

Why are there microservices?

A large system might consists of many services: HR, a basket checkout, payments, CRM operations, etc.

These services might be built out of microservices – change the prescription's content: add, remove, update, delete

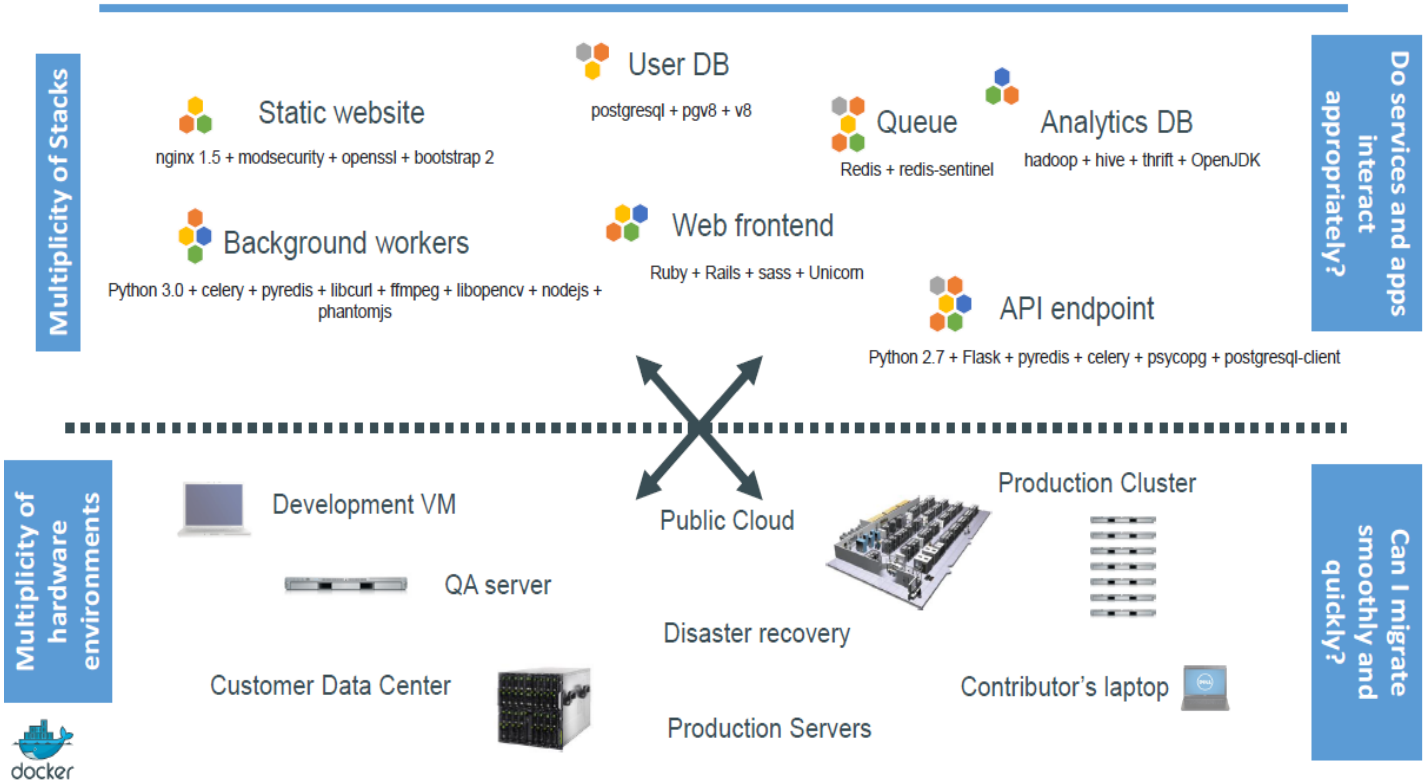
- These are microservices – that might be deployed as containers

Why Containers?

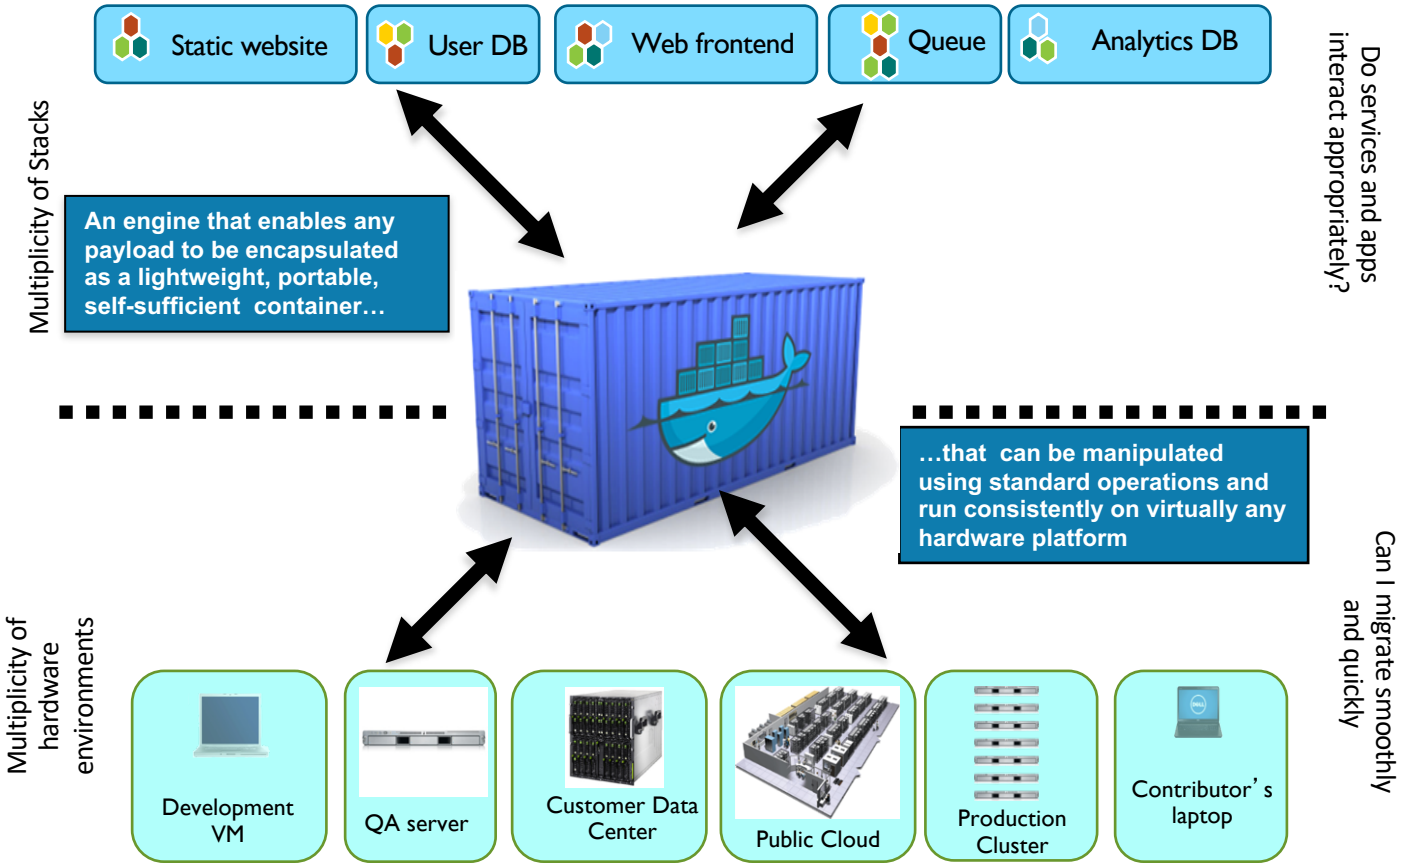
Everyone Loves Containers

- A standard way to package an application and all its dependencies so that it can be moved between environments and run without changes
- Containers work by isolating the differences between applications inside the container so that everything outside the container can be standardized

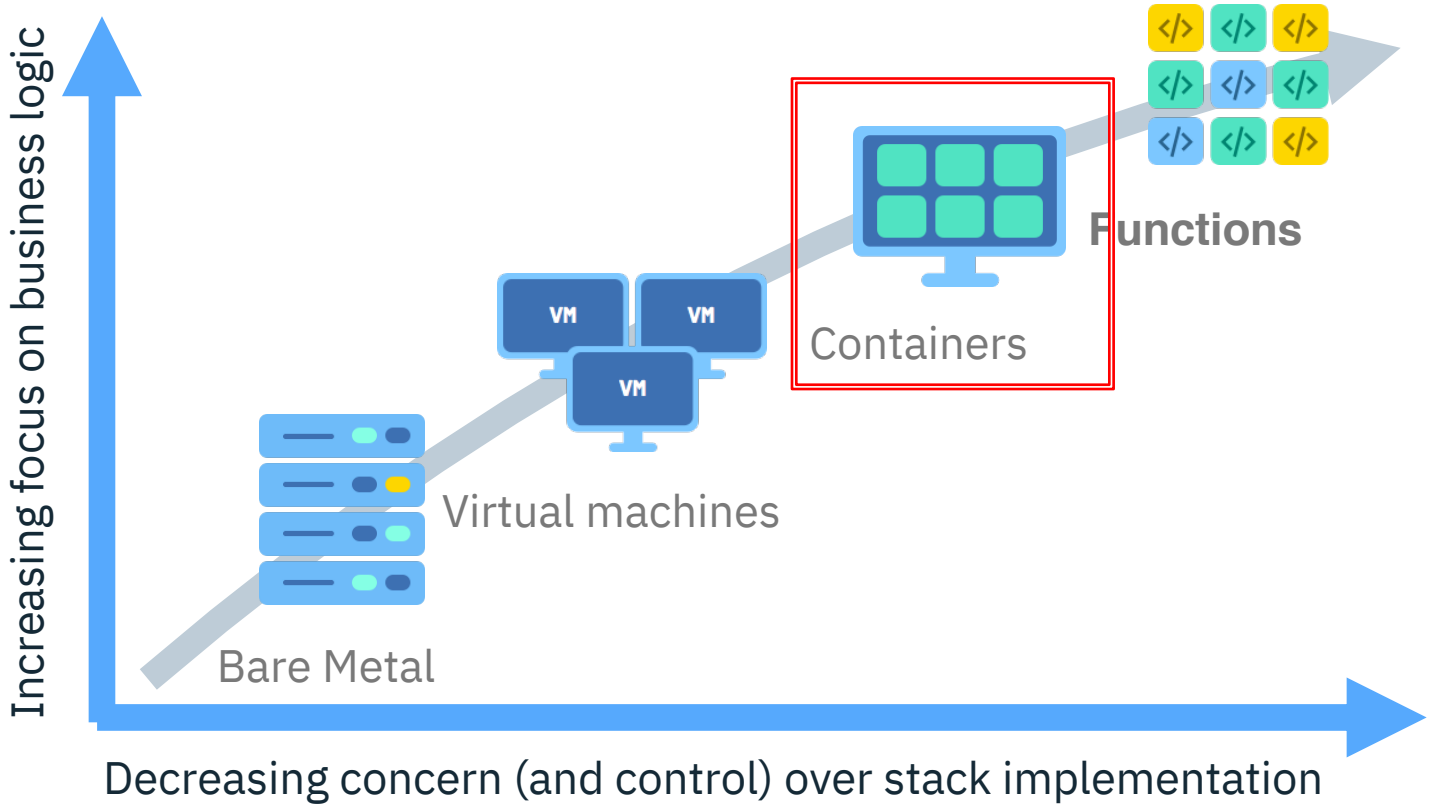
The Challenge



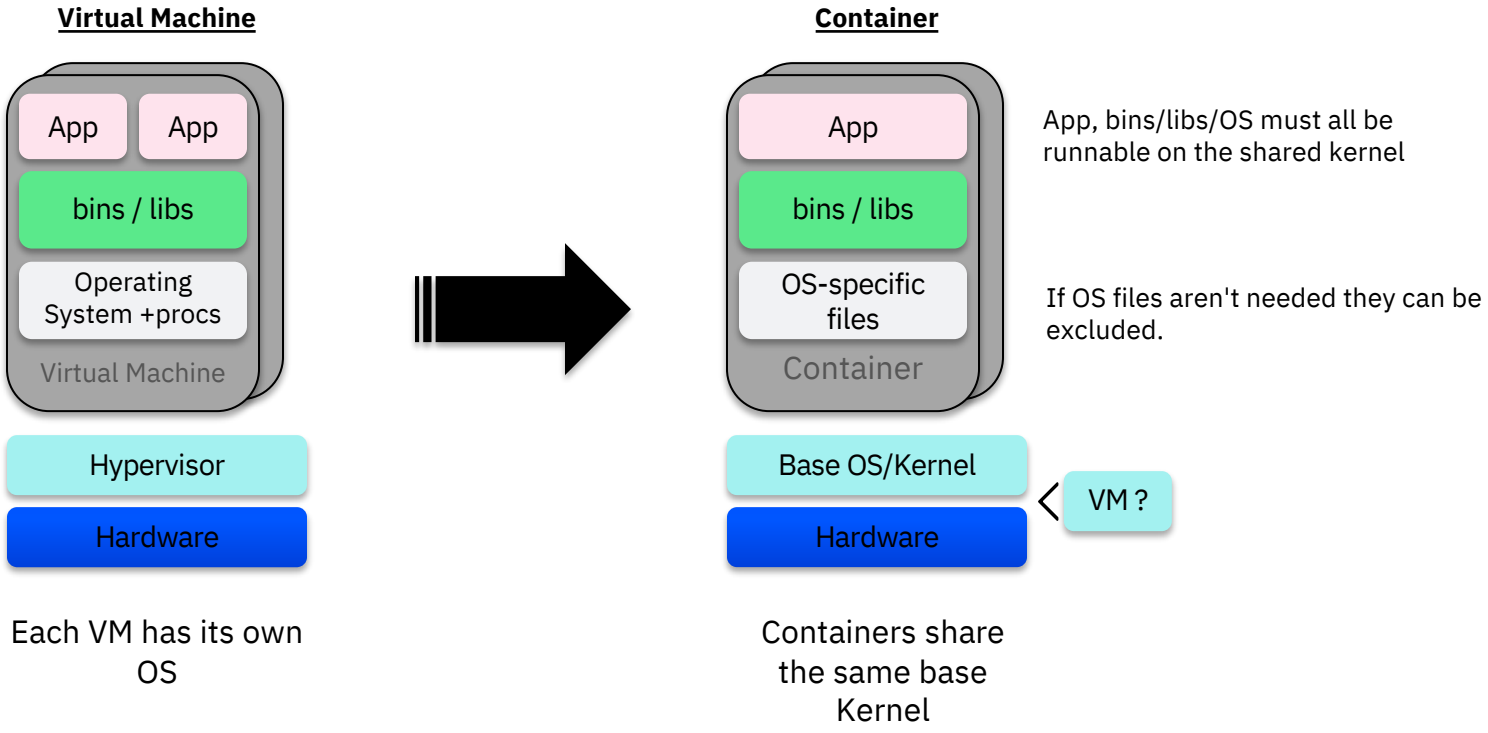
The Solution - A Shipping Container for Code



How we got here

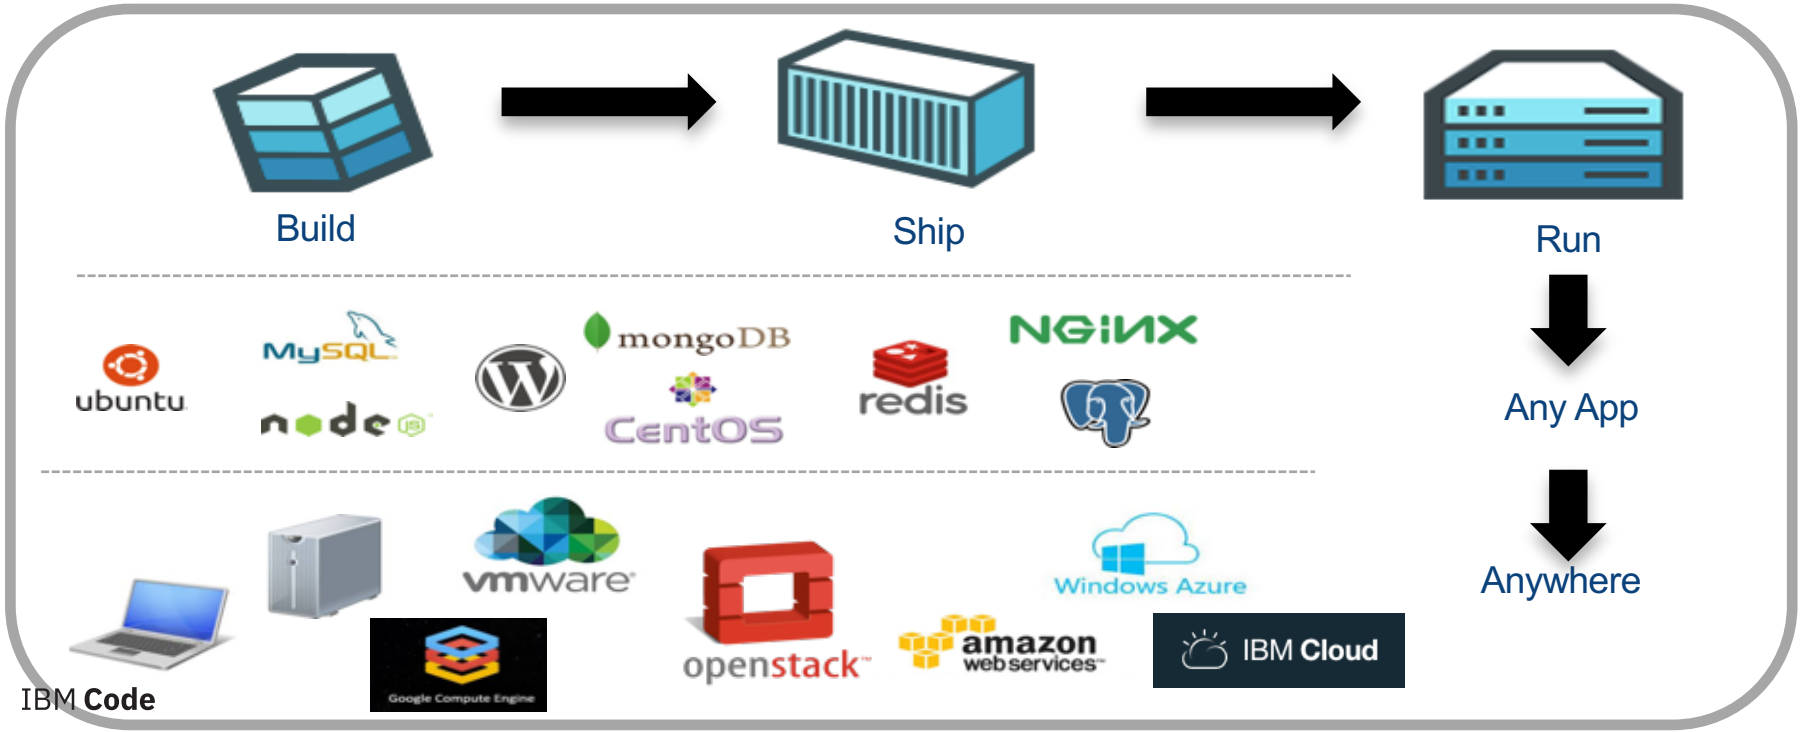


VM vs Container

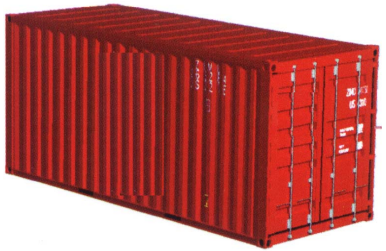


Docker Mission

Docker is an **open platform** for building distributed applications for **developers** and **system administrators**



Dev vs. Ops

Dev	Ops
	


• **Code** • **Libraries** • **Configuration** • **Server runtime** • **OS**	• **Logging** • **Remote access** • **Network configuration** • **Monitoring**

Separation of concerns

A container separates and bridges the Dev and Ops in DevOps

- Dev focuses on the application environment
- Ops focuses on the deployment environment

Docker Component Overview

Docker Engine

- Manages containers on a host
- Accepts requests from clients
  - REST API
- Maps container ports to host ports
  - E.g. 80 → 3582

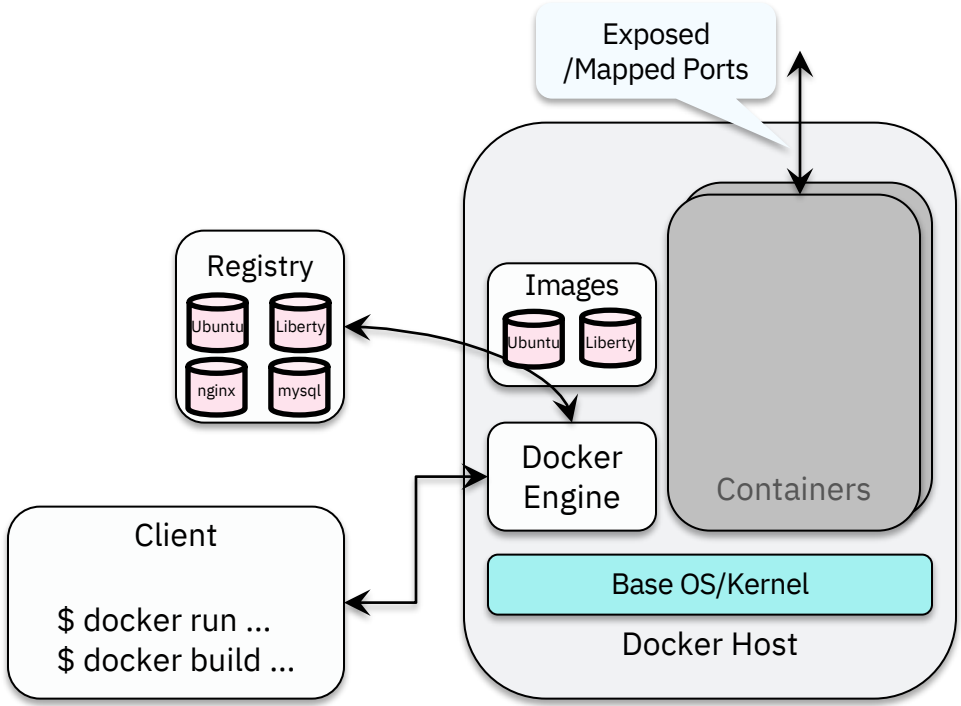
Images

Docker Client

- Drives engine
- Drives "builder" of Images

Docker Registry

- Image DB



Shared / Layered / Union Filesystems

Docker uses a copy-on-write (union) filesystem

New files(& edits) are only visible to current/above layers

Layers allow for reuse

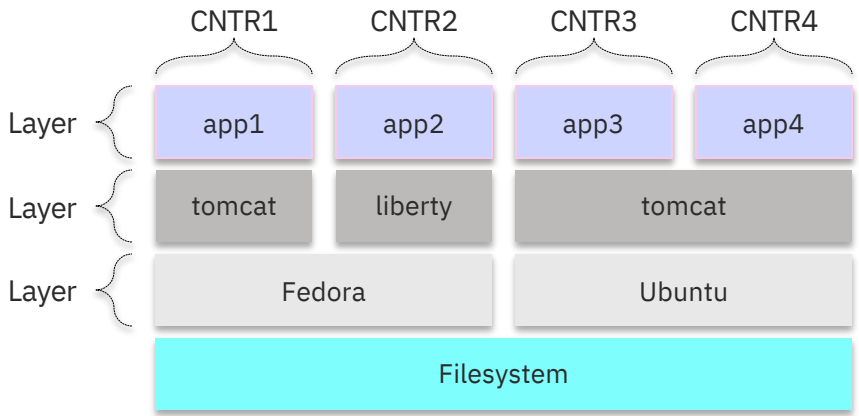
– More containers per host

– Faster start-up/download time

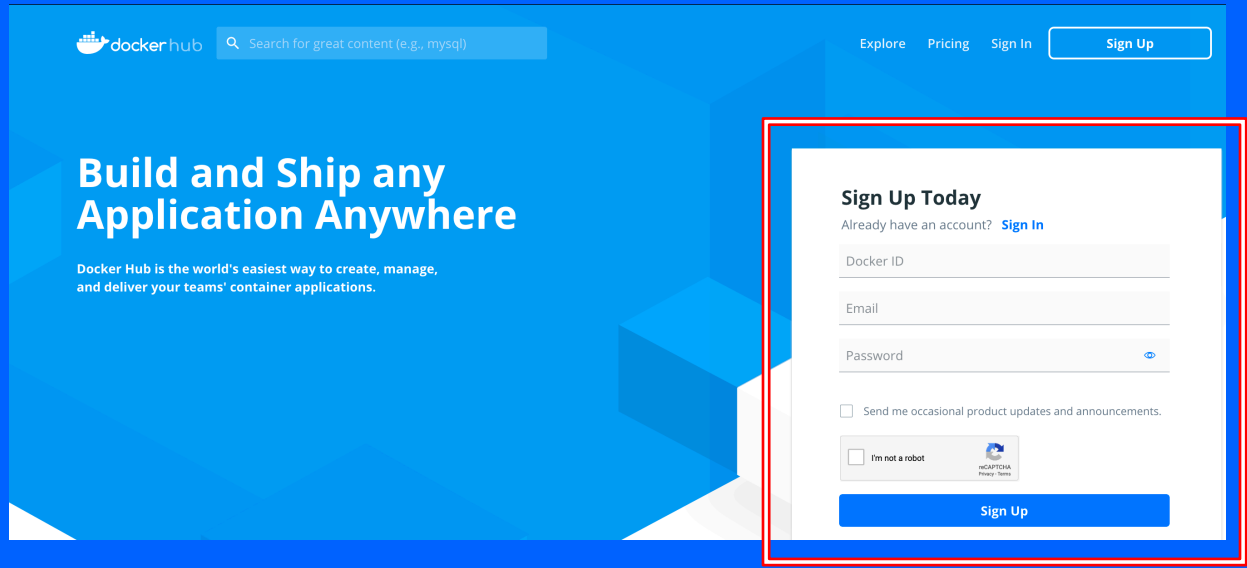
Images

– Tarball of layers

Think: Transparencies on projector



Download FREE Docker Desktop and use your terminal on your computer
or just sit back and watch



Our First Container

```
$ docker run ubuntu echo Hello World
Hello World
```

What happened?

- Docker created a directory with a "ubuntu" filesystem (image)
- Docker created a new set of namespaces
- Ran a new process: `echo Hello World`
  - Using those namespaces to isolate it from other processes
  - Using that new directory as the "root" of the filesystem (`chroot`)
- That's it!
  - Notice as a user I never installed "ubuntu"
- Run it again - notice how quickly it ran

```
Mareks-MBP:~ mareksadowski$ docker run ubuntu echo Hello World
Unable to find image 'ubuntu:latest' locally
latest: Pulling from library/ubuntu
6b98dfc16071: Pull complete
4001a1209541: Pull complete
6319fc68c576: Pull complete
b24603670dc3: Pull complete
97f170c87c6f: Pull complete
Digest: sha256:5f4bdc3467537cbbe563e80db2c3ec95d548a9145d64453b06
Status: Downloaded newer image for ubuntu:latest
Hello World
Mareks-MBP:~ mareksadowski$ docker run ubuntu echo Hello World
Hello World
Mareks-MBP:~ mareksadowski$
```

A look under the covers

```
$ docker run ubuntu ps -ef
UID          PID    PPID  C
STIME TTY          TIME CMD
root           1       0  0
14:33 ?        00:00:00 ps -ef
```

Things to notice with these examples

- Each container only sees its own process(es)
- By default running as "root”,
- And running as PID 1
- The good security practice is to run services as the user other than root, and avoid the privileged mode
- Limit the resources used by container – to avoid noisy neighbor effect

LAB 1

http://ibm.biz/202006-redhat-lab

Second part –
the orchestration
of successful API deployment

Containers

Everyone’s container journey starts with one container....

Containers

At first the growth is easy to handle....

Containers

But soon it is overwhelming... chaos reigns

Container Orchestration

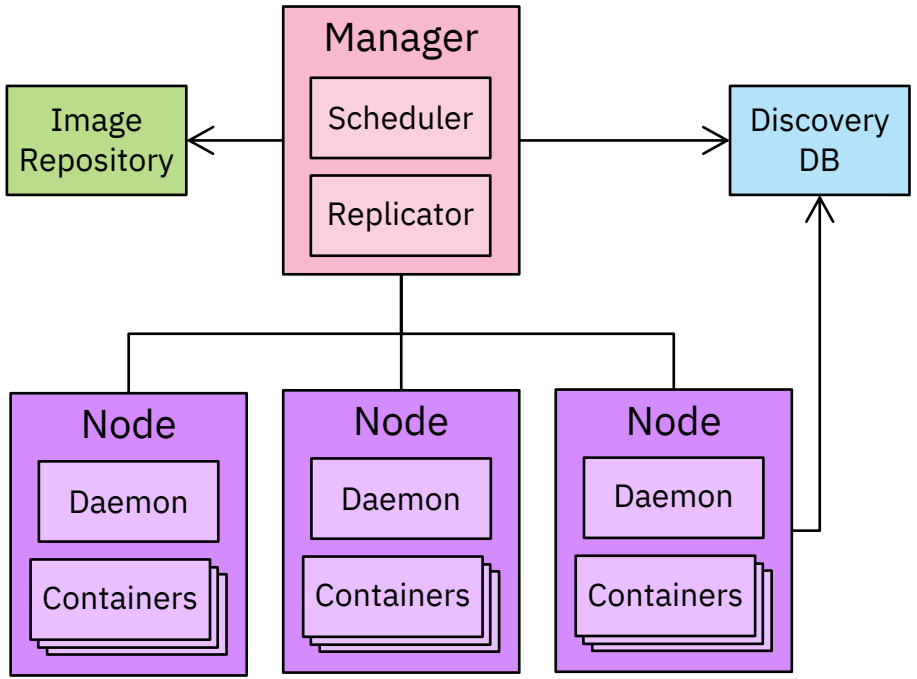
Allows users to define how to coordinate the containers in the cloud when the multi-container packaged application is deployed.

- Scheduling
- Cluster management
- Service discovery
- Provisioning
- Monitoring
- Configuration management

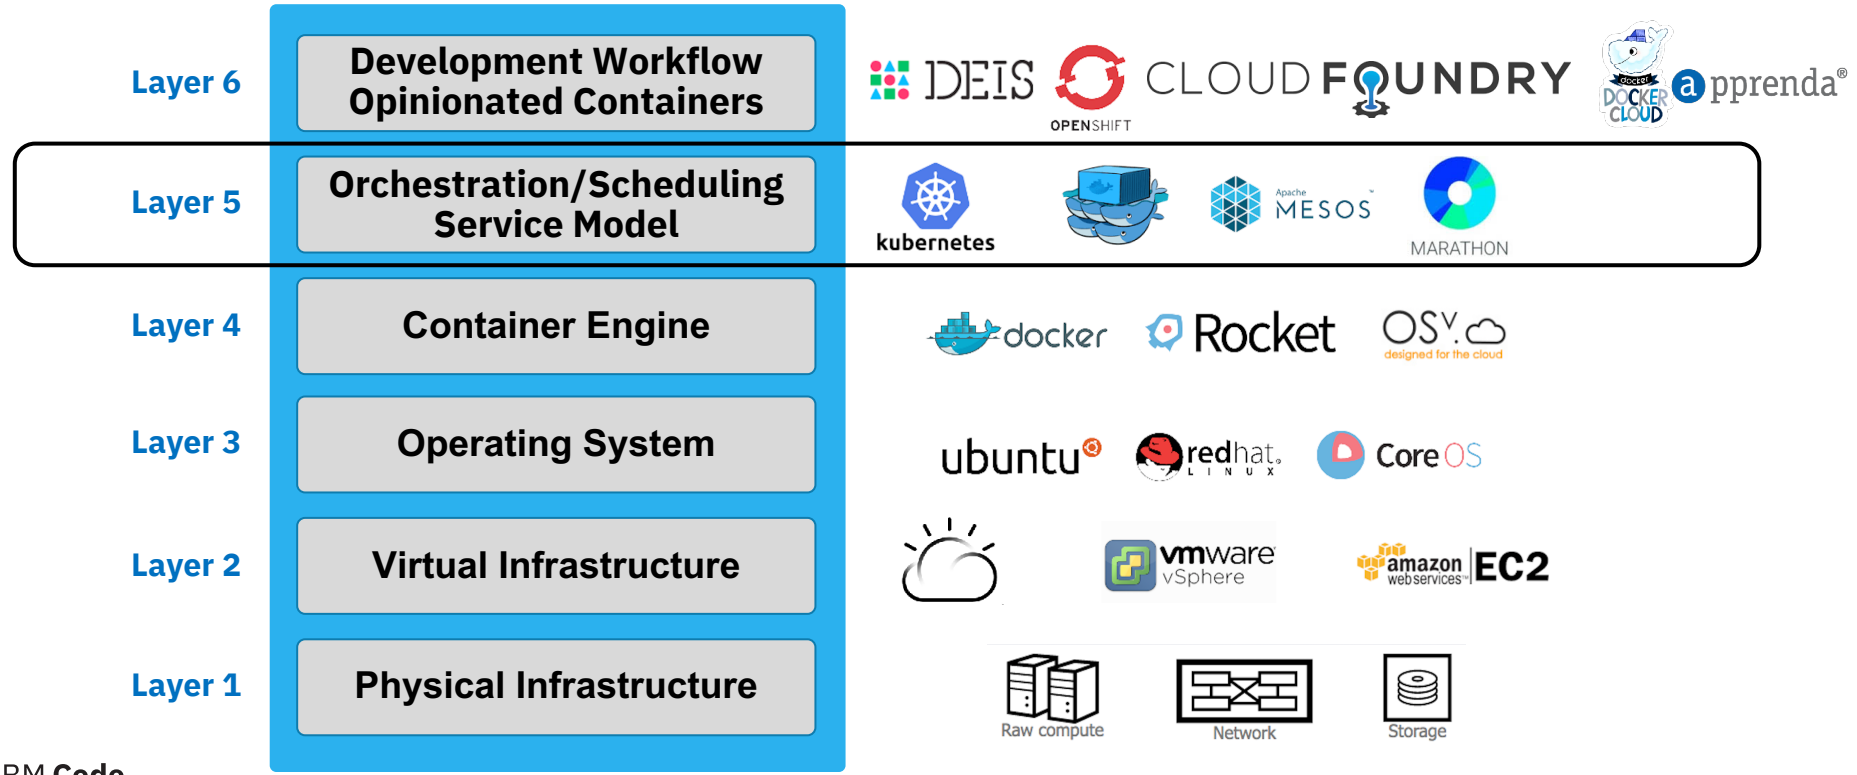
What is Container Orchestration?

- Container orchestration
  - Cluster management
  - Scheduling
  - Service discovery
  - Replication
  - Health management

Container Orchestrator



Container Ecosystem Layers

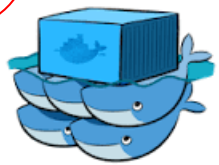


Kubernetes – Mesos – Marathon – Docker Swarm

Kubernetes is a cluster manager for containers (large deployments)

MESOS is a distributed system kernel that will make your cluster look like one giant computer system to all supported frameworks and apps that are build to be run on mesos.

(Kubernetes can be run on Mesos)



Swarm has a YAML-based deployment model, auto-healing of clusters, overlay networks with DNS, high-availability through the use of multiple masters, and network security using TLS with a Certificate Authority (1-10 containers)

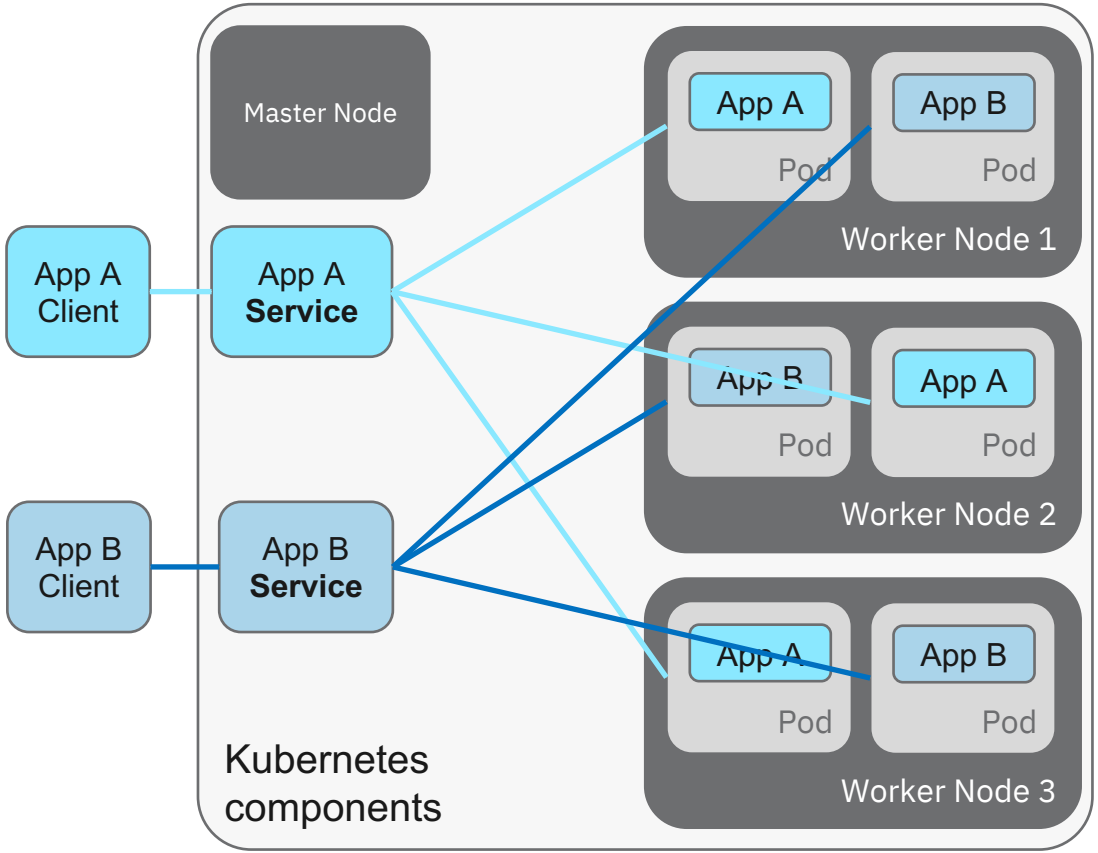
Marathon is a cluster-wide init and control system for running Linux services in cgroups and Docker containers, and it is run on top of Mesos

What is Kubernetes?

- Container orchestrator
- Manage applications, **not machines**
- Designed for extensibility
- Open source project managed by the Linux Foundation

Kubernetes Architecture: Workloads

- Container
  - Packaging of an app
- Pod
  - Unit of deployment
- Service
  - Fixed endpoint for 1+ pods



Kubernetes

Intelligent Scheduling

Self-healing

Horizontal scaling

Service discovery & load balancing

Automated rollouts and rollbacks

Secret and configuration management

Helm & Helm Chart

- Helm
  - Package manager for Kubernetes
  - Used to manage Kubernetes applications
- Helm Chart
  - Used to define, install, and upgrade complex Kubernetes applications
  - Easy to create, version, share and publish
  - Expressed in “Yet Another Markup Language” (YAML) files

Challenges with Microservices

Security

Canary deployments

A/B testing

Retries and Circuit breaking

Rate limiting

Fault injection

Policy management

Telemetry

What is a ‘Service Mesh’ ?

A network for services, not bytes

- Observability
- Resiliency
- Traffic Control
- Security
- Policy Enforcement

Istio

An open platform to connect, manage, and secure microservices

http://istio.io

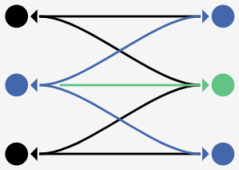
IBM Code

Istio community partners

- RedHat
- Pivotal
- WeaveWorks
- Tigera
- Datawire
- Scytale (SPIFFE)
- Microsoft
- Uber (Jaeger)

Istio

Connect, secure, control, and observe services.

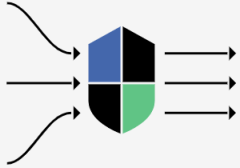


Connect

Intelligently control the flow of traffic and API calls between services, conduct a range of tests, and upgrade gradually with red/black deployments.

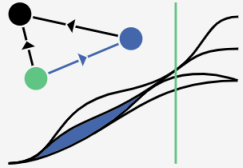
Secure

Automatically secure your services through managed authentication, authorization, and encryption of communication between services.



Control

Apply policies and ensure that they're enforced, and that resources are fairly distributed among consumers.



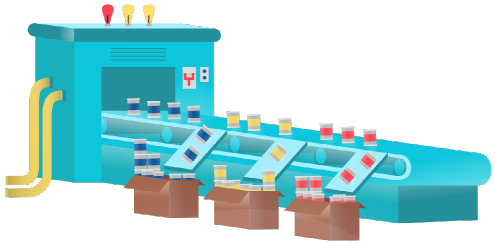
Observe

See what's happening with rich automatic tracing, monitoring, and logging of all your services.

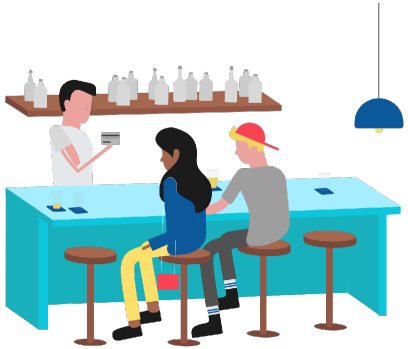
Istio

WHERE ISTIO FINDS ITS PLACE

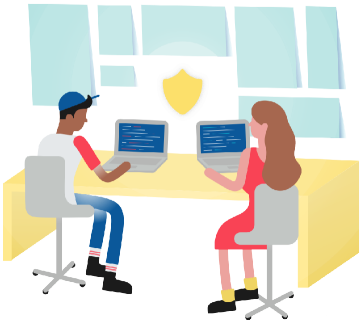
Intelligent Routing and Load Balancing



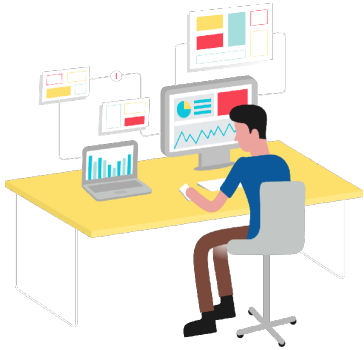
Fleet Wide Policy Enforcement



Resiliency across Languages and Platforms



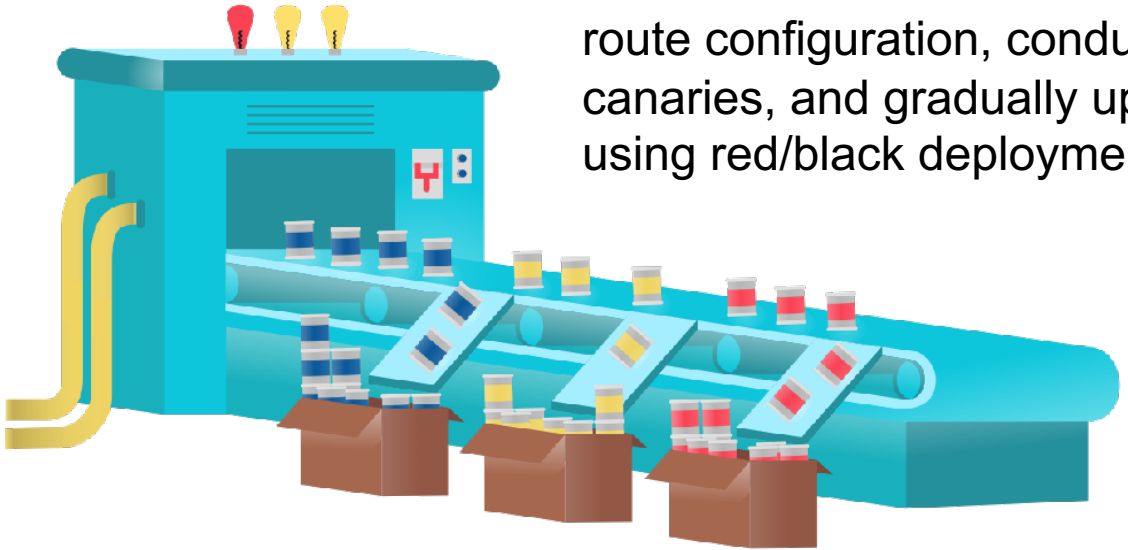
In-Depth Telemetry and Reporting



Istio

WHERE ISTIO FINDS ITS PLACE

Intelligent Routing and Load Balancing

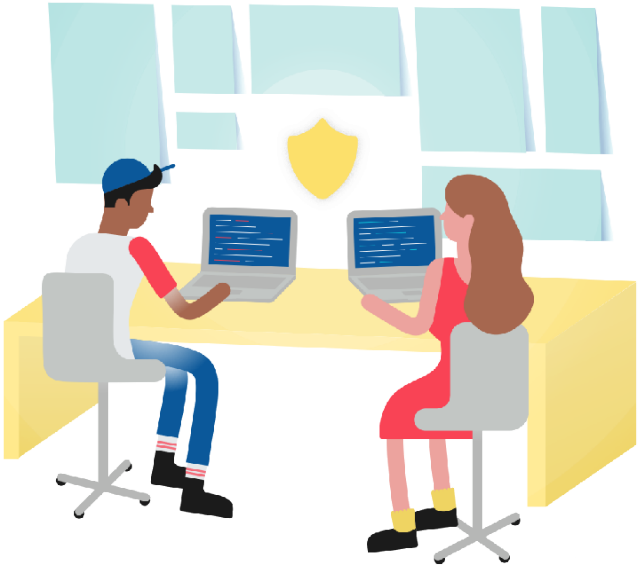


Control traffic between services with dynamic route configuration, conduct A/B tests, release canaries, and gradually upgrade versions using red/black deployments.

Istio

WHERE ISTIO FINDS ITS PLACE

Resiliency across Languages and Platforms



Increase reliability by shielding applications from flaky networks and cascading failures in adverse conditions.

Istio

WHERE ISTIO FINDS ITS PLACE

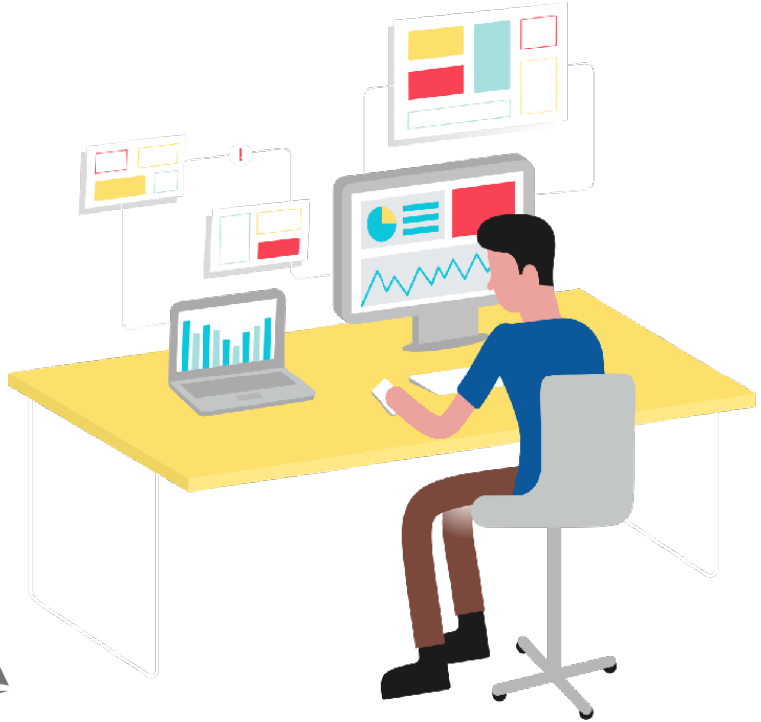
Fleet Wide Policy Enforcement

Apply organizational policy to the interaction between services, ensure access policies are enforced and resources are fairly distributed among consumers.

Istio

WHERE ISTIO FINDS ITS PLACE

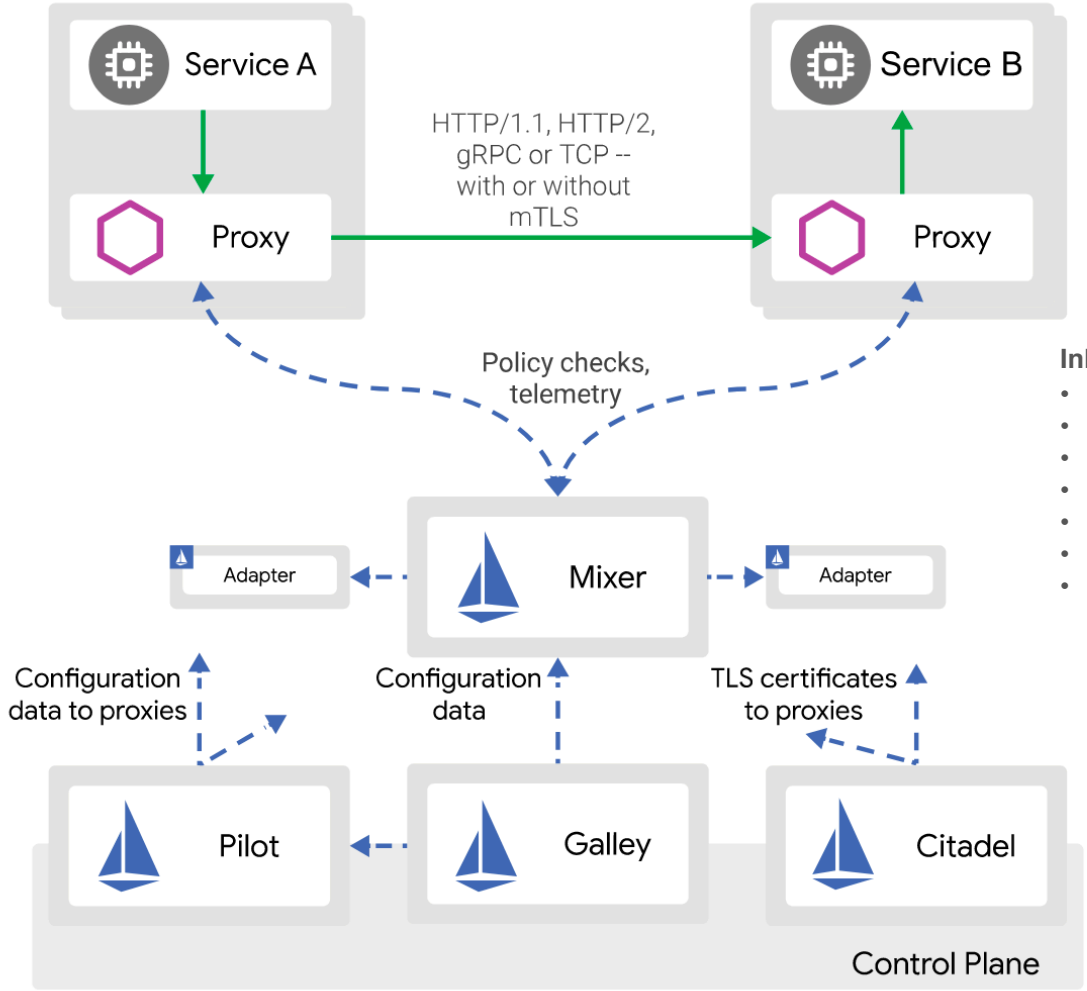
In-Depth Telemetry and Reporting



Understand the dependencies between services, the nature and flow of traffic between them and quickly identify issues with distributed tracing.

Outbound features:

- Service authentication
- Load balancing
- Retry and circuit breaker
- Fine-grained routing
- Telemetry
- Request Tracing
- Fault Injection



Inbound features:

- Service authentication
- Authorization
- Rate limits
- Load shedding
- Telemetry
- Request Tracing
- Fault Injection

What is Envoy

- **Out of process architecture**: Let's do a lot of really hard stuff in one place and allow application developers to focus on business logic.
- **Modern C++11 code base**: Fast and productive.
- **L3/L4 filter architecture**: A TCP proxy at its core. Can be used for things other than HTTP (e.g., MongoDB, redis, stunnel replacement, TCP rate limiter, etc.).
- **HTTP L7 filter architecture**: Make it easy to plug in different functionality.
- **HTTP/2** first! (Including **gRPC** and a nifty gRPC HTTP/1.1 bridge).
- **Service discovery** and **active health checking.**
- **Advanced load balancing**: Retry, timeouts, circuit breaking, rate limiting, shadowing, etc.
- Best in class **observability**: stats, logging, and tracing.
- **Edge proxy**: routing and TLS.

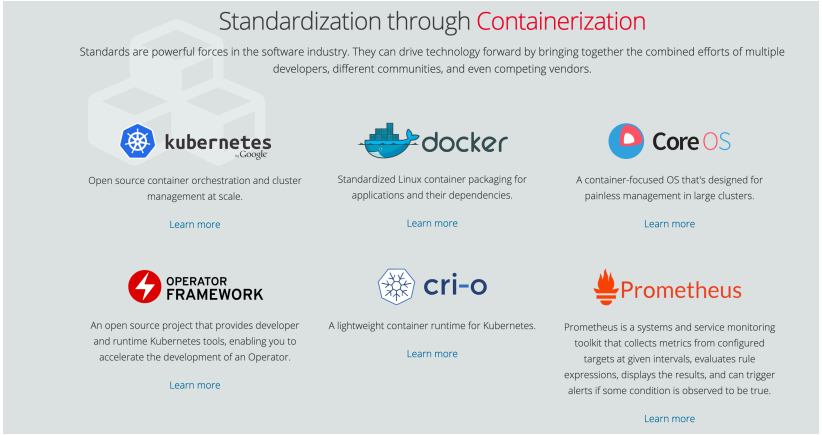
ALL IN ONE WITH THE SUPPORT

ORIGIN COMMUNITY DISTRIBUTION OF KUBERNETES

okd

The Origin Community Distribution of Kubernetes that powers Red Hat OpenShift.

Built around a core of OCI container packaging and Kubernetes container cluster management, OKD is also augmented by application lifecycle management functionality and DevOps tooling. OKD provides a complete open source container application platform.



Open Source | Secure | Fully Certified | Portable
